

c) LLM-Based Recommendations

Take a look at my blackberry bush, when should I harvest them?

The diagram illustrates an LLM-based recommendation system. A user asks a question about harvesting blackberries, and the LLM provides a recommendation based on the input image and text.

Recommendation:

The optimal harvest day is day 7 because 6 blackberries (54.5%) will be ready by then, which is a significant increase compared to harvesting today. If the harvest does not take place within the window of days 6 through 8, the blackberries will pass their peak and lose quality and market value.

Formulas:

Project q onto trajectories

$$P = C + \frac{(q - C) \cdot \alpha}{\|\alpha\|^2}$$

Find the trajectory

$$\beta = \min(\|q - P_1\|, \|q - P_2\|)$$

Maturation rate

$$\Delta_t = \frac{T_1}{\|\alpha\|}$$

Find the trajectory

$$\tau = \Delta_t \cdot \beta + T_2$$
